DETAILED ACTION

Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 80-119 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kopelman et al. in view of Rockwell, US Patent 375,773. (Note that no patentable weight has been given in regard to all the subject matter referenced by “intended for”, since intended use is not patentable subject matter.) As seen in the figures, center part 111 is between distal and proximate parts 110, 112, as claimed. This center part engages a users palm, as claimed. In regard to the claimed geometric arrangement of surfaces, including longitudinal axis, imaginary plane, maximum central point, minimum point, generatrix, convex progression, etc., none of these limitations are novel and are provided by Kopelman. In regard to the claimed percentages and specific measurements of length and curvature, it is noted that these limitation are met by a combination of the specific size that Kopelman

has the handle built, which can vary, and the size of a user's hand. Even if a standardize size handle was used, there would be individuals (assigned group of hands) having hands that would meet the claimed limitations during use of the handle of Kopelman.

Kopelman discloses the claimed invention except for explicitly teaching the asymmetrical center part relative to a plane including the maximum point and the longitudinal axis. Rockwell teaches the concept of having an asymmetrical center part (*c* or *b*) as claimed. Such an arrangement allows for the resistance of axial rotation. It would have been obvious at the time the invention was made for one skilled in the art to have utilized this concept taught in Rockwell, for the purpose of providing resistance to axial rotation.

Conclusion

3. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is

filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.
